## MEURSAULT

### LES GRANDS CHARRONS

This locality is located on a hillside on a clay-limestone soil and on three different types of subsoil:

- Bottom of the hillside: Gravel subsoil composed of a mixture of gravel and yellow clay. This kind of subsoil can be found all along the coast, from Marsannay to Santenay. It brings the floral side and finesse.
- Middle of the hillside: Clay-limestone soils for fat and opulence and scree of round stones.
- Top of the hill: Very hard white limestone which gives us minerality.
